

**azar nasim**  
AIR CONDITIONING COMPANY

---

## AIR HANDLING UNIT

## Features

---

In all Azar Nasim air handling units the frames are from aluminum profiles while the chassis and body panels are made from galvanized steel sheets in appropriate thicknesses.

Azar Nasim air handling units are manufactured in sections descriptions of which are offered below. All units are completely painted in the proper thickness.

Azar Nasim has a wide range of air handling units for use in various applications from small office premises to larger industrial applications. Common to all items in the range is that systems and components have been to satisfy stringent demands for low energy consumption. Heat exchangers, motors and fan units have all undergone extensive testing, both in the laboratory and out in the field, in order to comply with current and future demands for low energy consumption. All products are also manufactured to comply with environmental requirements. To ensure easy installation, many of these units feature control systems enabled for plug-and-play, i.e. simple start-up. Azar Nasim air handling units are manufactured in sections descriptions of which are described below. Heat exchangers, motors and fan units have all undergone extensive testing, both in the laboratory and out in the field, in order to comply with current and future demands for low energy consumption. All products are also manufactured to comply with environmental requirements. To ensure easy installation, many of these units feature control systems enabled for plug-and-play, i.e. simple start-up. Azar Nasim air handling units are manufactured in sections descriptions of which are described below.

### ❖ Frame

- Low weight, corrosion resistant, marine aluminum alloy twin box section profile, is designed to provide strength and stability
- Polyamide gaskets between the frameworks panels and profiles, to allow efficient cleaning and prevent trapping and harmful bacteria growth
- Optional thermal bridge free profile For each component of the system a specific frame is made by Azar Nasim Company which will be discuss in the related sections.

## ❖ Panels

Panels used in Azar Nasim air handling units consist of an interior sheet, an exterior sheet, and insulating material. The insulating material is places in pieces between the interior and exterior sheets.

Since interior and exterior sheet thicknesses used for panels are much less than the thickness of the insulating, sheet thickness does not have much effect on the thermal conductivity coefficient of the panel. The dimensions and material used in Azar Nasim AHU is described below.

- Standard 20mm or 50 mm thick (other thickness optional) double skinned galvanized panels
- 0.75mm internal and 1.5mm external skins with 50kg/m<sup>2</sup>to 70kg/m<sup>2</sup> density glass wool, rock wool or k-Flex insulation.
- Return "K" value of 0.036W/m<sup>2</sup>K
- Optional panels manufacturing from pre-plastic coated steel, pre-painted metal or stainless steel
- Different thick panels available upon request.

## ❖ Fans

The air handling unit includes a fan cell for the purpose of facilitating air circulation through an aspirator and/or ventilator, depending on the requirements of the environment. While forward curved fans are preferred for units within the low pressure range, forward curved or reverse curved fans can both be used for units within the medium and high pressure ranges. In addition to these, Aero-foil fans are commonly preferred due to their efficiency and low noise level operation. Depending on design conditions Plug (without scroll case, single inlet, direct coupled) fans can also be used.

Fans and housing used in Azar Nasim air handling units are manufactured from galvanized sheet metal. One or two double inlet, double width forward or backward curved centrifugal fans are used in Azar Nasim air handling units. Aerodynamic Inlets design, with static and dynamic balancing of the wheels according to airflow and speed is the main purpose. Fans and pulley are connected by a key to the shafts and designed for continuous operation at maximum rated fan power and speed.

Shafts and other power transmission components such as pulleys and belts are also suitably chosen depending on the required fan speed and electric motor power. The connection of the fan to another cell may be made by a diffuser. The basic purpose of the diffuser is to distribute the air flow in the subsequent cell evenly within the cell.

Fan, motor and drives are mounted on a fan and motor base that is isolated from the air handling unit by a set of anti-vibration isolators at the bottom in order to eliminate transfer of vibrations to the structure. To further reduce the effects of vibrations, fan outlet(s) are also connected to the structure via flexible material such as canvas. In cases where an air washer section is included, the blower electric motor is installed outside of this section to prevent adverse effects of moisture. In other cases, blower electric motor is installed in the fan section.

Electrical motors can be selected in the IP54, IP55, IP65 protection, and EFF1, EFF2 energy classes depending on place of use and on demand.

### ❖ Motor

Motors used in Azar Nasim air handling units are F isolation class, 380 V 50 Hz tri phase, enclosed, fan cooled and equipped with short circuit rotor as a standard. All 380V/30/50Hz electric motors are selected with insulation class of (F) and ingress protection of (IP-54). Electric motors with ingress protection of (IP-55) are also available upon request.

### ❖ 3 - Mixing box section

This section is where the fresh and return air streams are mixed in the mixing box. An independent air damper is included for each air stream.

Dampers are manufactured from aluminum in opposed blade configuration and air sealed through the use of rubber strip gasket . Damper actuators ma y be easily installed when required.

Washable aluminum filter modules 2 inches in thickness are arranged in (V) type configuration inside these boxes. A Housing for pleated type air filters may also be considered in the mixing box .

### ❖ Dampers

Dampers are equipment which allows flow rate adjustment by altering the air passage cross-section by its blades rotating on horizontal pins. These are used in air mixing and heat recovery units, for the purpose of handling the precise flow rate adjustment in an economical fashion.

Dampers are manufactured from aluminum in opposed blade configuration (to allow precise adjustment of the air flow rate) and air sealed through the use of rubber strip gasket. While setting dimensions of fresh air dampers in mixing chambers, the dimensions are determined to allow operation with 100% fresh air as required by the free-cooling system which can be used in transitional seasons. Damper openings can be controlled manually or by servo motor. Damper actuators may be easily installed when required, but the main issue which requires attention is to provide the air mixture rate needed for the system.

### ❖ Filters

One of the purposes of the air handling unit is to ensure the purity of the room air. Air filtering is related to the quantity, variety and size of the suspended impurities, the existence of contaminant gases or odors, and the desired filtering efficiency. For this reason, various filter classes with the ability to filter particles of various diameters have been developed. In Azar Nasim air handling units, various filtering options are applied and optimum options are offered depending on the place of use and upon requirements. Filter sections are designed for easy side withdrawal of the following filter types:

### ❖ Aluminum washable

High capacity, low resistance, permanent metal filters, which can be cleaned in hot water with detergent. They can be used for air cleanliness required 65-70% pollutants or as an economical alternate to disposable type pre - filter of high efficiency filter. Washable aluminum filter is made of a 5cm module in thickness encloses 5 flattened and corrugated aluminum sheets layers arranged in (V) type configuration.

Note: aluminum filters are installed in the mixing box section, not in the filter section.

## ❖ Panel Filters

Synthetic or glass-fiber media panel filters, class EU3 to EU5 (EU3 supplied as standard) arranged in galvanized steel frames. The decisive point in the design of these filters which have a gravimetric efficiency of 85-95%, is creating a corrugated structure and hence a larger filtering surface.

Its advantages with respect to flat filters are:

- Greater filtering surface
- Reduced front air velocity
- Greater efficiency
- Greater dust retention capacity
- Reduced front surface

Note: In cases where only pleated filters are required they are easily installed in the mixing box and not in the special filter section.

## ❖ Bag Filters

Synthetic or glass-fiber media bag filters, which allow a high filtering flow rate in relation to the front surface area, arranged in galvanized steel frames from class EU6 to EU9 (EU6 supplied as standard).

This equipment has the following advantages:

- Lower power requirement.
- Longer filter renewal interval.
- Lower energy costs.
- Lower maintenance.

## ❖ Hepa Filters

Require careful installation that guarantees complete air tightness of all gaskets. They are designed to eliminate virtually even the smallest particles in the air, i.e., those in continuous suspension (the smallest of these are only visible using electronic microscopes). Filters are available in 99.97 or 99.99 % efficiency with plywood or galvanized steel casing from class EU11 to EU14. Hepa filters are installed on specially designed knife edge type seal framing system with pressure tight lock to prevent air bypass. They are specially recommended for:

- Hospitals
- Food industries
- Pharmaceutical companies
- Clean rooms
- Absolute filtering of air in environments with controlled contamination

They should be installed immediately before the space requiring this virtually sterile air that these filters can supply.

## ❖ Air HANDLING UNITS EQUIPPED WITH WATER-TO-AIR HEAT RECOVERY UNITS

Air Handing Units with water-to-air recovery units come with one copper tube/ aluminum wing coil to recover energy contained in the air released from the exhaust system on the equipment. A second coil is also installed at the fresh air section with the same characteristics. The aim of the second coil being installed is to transfer the energy obtained at the exhaust side into the fresh air.

## ❖ AIR HANDLING UNITS WITH PLATED TYPE HEAT RECOVERY

The philosophy for systems with plated air to air recovery units is slightly different. In this system, the energy transfer is made directly to fresh air from the exhaust air without any transferring liquid fluid (in reverse order for cooling conditions).

In the heat recovery units which are named as plated, aluminum plates are used which are shaped in a way to create different ways for the exhaust air and the fresh air. Fresh air and exhaust air meet on the unit in a way that they can never mix up and there accrue a heat exchange through the plates. In the practices where the air mixture is undesired, they are preferred with their high efficiency and they are the most common heat recovery units in this area. The fixed plated models are produced from aluminum material and they also facilitate inox and coating epoxy applications for different environments. Effective efficiency of those equipment can be up to 70% depending on the usage.

#### ❖ AIR HANDLING UNITS WITH ROTARY TYPE HEAT RECOVERY

Rotary type heat recovery units are the most efficient heat recovery units in this area. The effective efficiency of the units varies from 50% to 85% depending on usage. Due to usage and installation, a slight unintentional mixture (2-5%) might occur. For the projects in which those mixtures are ignored, those units are preferred thanks to their high efficiency. In addition, with a proper Rotary type heat recovery units

are made of aluminums plated encircled one on the top of another. The plates are shaped in a way to allow airflow when they are one over the other. Units produced this way are installed into the air handling unit in a case. Those units make the epoxy application possible for hard conditions. They can also be produced in different types as Condensation and Enthalpy rotary to be suitable for the intended use.

#### ❖ Humidification

The humidification unit is used to control the relative humidity of the ambient air by increasing the absolute humidity of air in the air handling unit. Water spray humidifiers are used in Azar Nasim air handling units in three different classes according to the application type

## ❖ Air Washer

This is an air handling unit section which houses a series of water sprays which produce very small particles that come into contact with the circulating air flow and produce a high level of evaporation. The bottom of this section contains a drip pan, from which water is sent back to the sprays, with only evaporated water added back to the system. The water container manufactured from thick galvanized steel and protected by fiber reinforced polymer. The system requires the use of a water circulation motor pump, which is not normally included in the supply of this section. A price quote may be provided, however, upon request. The standard pump is supplied by electricity at 220 V / 3 phase/ 50 Hz. To prevent the entrainment of water particles, this type of humidifier is always equipped with a drip separator at the air outlet as a safety measure. Drop retainers are manufactured from polypropylene material or optionally from stainless steel material. Water spraying can be done either in the same or the opposite direction of air flow, resulting in different saturation efficiencies. The use of multiple units also increases efficiency, with the following experimental results obtained:

One unit only, same direction as air flow 60% efficiency:

- One unit only, opposite direction as air flow 75 % efficiency

Dual unit, same direction as air flow 84% efficiency:

- Dual unit, one in same and one in opposite direction 90% efficiency:
- Dual unit, opposite direction to air flow 95% efficiency

Azar Nasim air washers are designed & manufactured in three basic classes. Class 4: A compact & economical single spray bank air washer specially designed for effective humidifying & air washing purposes.

**Class 6:** A single spray bank unit for medium capacity applications is the ideal air washer for most types evaporative cooling & air washing tasks.

**Class 8:** A highly efficient heavy duty unit with two spray banks used whenever the utmost in heat transfer, humidification or air cleaning is required.

Basins are 300 mm deep for classes 4 & 6, 400 mm deep for class 8.

Moisture eliminators installed side by side in close proximity of each other preventing the water droplets from entering the fan section. They also present a large surface area against which water droplets & dust particles first impinge before ending up in the basin.

Centrifugal spray nozzles contain no cores, vanes or obstructions of any kind and all inside surface are smooth. Nozzles have removable caps which can be taken off for cleaning purposes. Brass flooding nozzles are installed on separate headers extending across the air washer. They deliver a solid flat stream of water on to the eliminator surface in order to wash off the dust particles & deposits. An access door with glass inspection window is available on all models. Make-up water connection & an automatic float valve which controls the water level in the basin are provided Quick fill connection to which the fresh water supply may be connected is furnished for rapid filling of the basin.

### ❖ 5-Multi - Zone Section

In some cases the air conditioning design of a building defines different zones to be air conditioned, each zone requiring its own air flow rate and air temperature. In these cases instead of using a few air handling units, a multi -zone unit is usually chosen. In the multi-zone air handling unit, cooling and the heating coils are paralleled with each other which means that some of the air passes over the cooling coil and the remainder passes over the heating coil and at the outlet the result is a mixture of the two which has the suitable temperature for each zone. In multi- zone units the cooling coil area is the same size as that of a regular air handling unit while the size of the heating coil is less. For each zone two outlet dampers one which is on the cooling coil side and one that is on the heating coil side activate. Of these two outlet dampers as one opens the other one closes the same amount therefore, by adjusting the outlet dampers for each zone, the desired zone temperature is controlled. Number and the effective area of dampers for each zone are dependent on the number of zones and the air flow rate needed for that zone. These aluminum dampers are located either on top or the back side of this section depending on whether the type of air handling unit is up blast or horizontal blast discharge. Multi-zone section is usually installed after the fan section and in order to have the proper air flow over the coils an air diffuser is also installed. Humidifiers are also installed in this section when required.

### ❖ Hygienic Air Handling Units

The basic logic in its design is to form a structure which does not allow dirt accumulation, which is clean and whose cleanliness can be controlled. Air Handling Units comprise an extremely rigid sealed frame construction, therefore gaps between panel junctions are minimal, and consequently air leakage is greatly reduced. Profiles and corners forming the

skeleton have been manufactured from aluminum extruded profiles & polyamide corners internally round corner and edge eliminate microorganism growth at sharp edges and holes. In line with the requirements of hygienic air handling units, panels, profiles and sealing elements are manufactured from material which does not allow microbiological propagation and which can be chemically cleaned. An external aluminum profile maintains structural integrity and air-tightness without compromising the thermal-bridging characteristics of the unit and the special design eliminates the possibility of condensation, preventing contamination of the system. To protect the system from bacteria development and maximize Indoor Air Quality, two main conditions must occur:

1. Prevent the moist conditions that encourage bacterial and fungal development by using steam humidifiers rather than water spray systems.
2. Ensure that the Air Handling Unit is frequently cleaned.

#### ❖ UV - C germicidal lamps

Air used in air handling units is cleaned with filtering systems. The coarse dust and particles in the air are captured with filters. Micro-organisms which are suspended in air and cannot be captured by regular filter systems, i.e. bacteria, viruses, moulds and funguses which threaten the health of humans, have their effect on personnel working in indoor spaces and on the product being manufactured. This leads to many financial losses.

Ultraviolet (UV) systems prevent all these microbiological problems. UV rays allow air sterilization. UV rays also neutralize bacteria which cause unwanted odors in the environment. UV air sterilization is a biological purification.

Areas of use: Hospitals (intensive care, operating room, corridors, waiting rooms), public health clinics, examination rooms, waiting halls, public offices and organizations, schools, hotels, plazas/offices, movie/theatre halls.

#### ❖ Selection Procedure

The first parameter to consider in the selection of an air handling unit is the required air flowrate (CFM) therefore, by having the required air flow rate, coil face area and the available nominal air flow rate for the unit, the appropriate model may be chosen.

**Note :**

Allowable air velocity over cooling coil less than 550FPM. In air handling units equipped with air washers this allowable air velocity must be reduced further to less than 500 FPM.

Considering the cooling and heating loads and the entering air conditions. The number of coil rows, pressure drops on both water and air sides and the required model of fan may be determined using the data available in the catalogue. Other components and accessories such as air mixing box, special filters, humidifier, etc. May also be selected from the catalogue as needed.

## **(Chilled Water Cooling, Hot Water Heating)**

---

Given:

Required air flow rate = 10000 CFM

Cooling entering air condition = 80 F°DB, 67 F° WB Heating entering air condition = 60° F DB

Entering chilled water temp. = 45°F Leaving chilled water temp. = 55 F Entering hot water temp. = 180 F Leaving hot water temp. = 160 F Total cooling load = 480 MBH

Total heating load = 700 MBH Cooling & heating coil FPI = 14

External static pressure drop. = 0.78 In W. G Maximum coil face velocity = 500 FPM

Filter arrangement = V - type

Considering the required airflow rate in cfm and the unnominal airflow rate, model SRAH - 1000 is chosen. From table 2 @ the given cooling capacity and the chilled water temp. A 6 - Rows coil is chosen. (Cooling capacity of the unit is 498 MBH) From table 5 @ the given heating capacity and the hot water temp. A

2 - Rows coil is chosen. (Heating capacity of the unit is 726 MBH).

Note:

In cases where the requirement for number of fin per inch is not specified, a coil with the least number

of rows with either 8,10,12 or 14 FPI which satisfies the requirement is chosen. Preference is usually given to 14 FPI.

- Determine the actual coil face velocity.

$$\text{F.V. Actual} = \frac{\text{CFM}}{\text{F.A.}} = \frac{10000}{20} = 500 \text{ FPM}$$

-Knowing the actual coil velocity and the coils chosen, determine the total internal air side pressure drop for the unit. From the table.

- P.D. Cooling coil = P. D. (Table 10) x C.F. (Table 10A) = 0.85 \* 1.45 = 1.19 In W.G
- P.D. Heating coil = P. D. (Table 10) x C.F. (Table 10A) = 0.22 \* 1.45 = 0.32 In W.G
- P.D. Filter = 0.099 In W.G
- P.D. Accessories= 0.05 + 0.06 = 0.11 In W.G (damper & mixing box from table 11).
- Total internal pressure drop (T.I.P.D)
- Total external pressure drop (T.E.P.D)
- T.I.P.D = P.D. Cooling coil + P.D. Heating coil + P.D. Filter + P.D. accessories
- T.I.P.D = 1.19 + 0.32 + 0.099 + 0.11 = 1.719 In W.G
- Total static pressure (T.S.P) = T.I.P.D + T.E.P.D = 1.719 + 0.78 = 2.5 In W.G

Therefore, by using table 18A and performing interpolation the required fan size is determined as 22" at the speed of 703 RPM and electric motor power requirement of 10 HP .

- Determine the water side P.D. (Cooling Coil):

$$\text{Total Cooling load} \quad 498000$$

$$\bullet \text{ Water flow rate (GPM)} = \frac{\text{Total Cooling load}}{500 \times \Delta T} = \frac{498000}{500 \times 10} = 99.6 \text{ GPM}$$

$$\text{Water Flow Rate (GPM)}$$

$$\bullet \text{ Water velocity inside the tubes} = \frac{\text{Water Flow Rate (GPM)}}{\text{No. of coils} \times \text{No. of circuits} \text{ (Table 19)}} = \frac{99.6}{1 \times 28} = 1.235 =$$

$$= \frac{99.6}{1 \times 28} \times 1.235 = 4.39 \text{ Ft / Sec}$$

From table 21 considering the 6 row cooling coil, the water velocity of 4.39 Ft/Sec the pressure drop is given as 10.52 Ft. W.G. -Determine the water side pressure drop (Heating Coil):

$$\text{Total heating load} \quad 726000$$

$$\bullet \text{ Water flow rate (GPM)} = \frac{\text{Total heating load}}{500 \times \Delta T} = \frac{726000}{500 \times 20} = 72.6 \text{ GPM}$$

$$\text{Water Flow Rate (GPM)}$$

$$\bullet \text{ Water velocity inside the tubes} = \frac{\text{Water Flow Rate (GPM)}}{\text{No. of coils} \times \text{No. of circuits} \text{ (Table 19)}} = \frac{72.6}{1 \times 28} = 1.235 =$$

$$= \frac{72.6}{1 \times 28} \times 1.235 = 3.2 \text{ Ft / Sec}$$

From table 14 considering the 2 row heating coil, the water velocity of 3.2 Ft/Sec, the pressure drop is given 2.62 Ft w.g and a. The average water temp, of 170 F correction factor is 0.77 therefore, the actual P.D. is 2.02 Ft W.G.

### (D.X. COOLING, STEAM HEATING)

---

Given:

Require air flow rate = 9500 CFM

Cooling entering air condition = 80 °F DB, 67 °F WB

Heating entering air condition = 60 °F DB

Total cooling load = 450 MBH

Total heating load = 950 MBH

Cooling coil FPI = 14

Heating coil FPI = 8

Evaporating temperature = 45 °F

Steam pressure = 5 psi

External static pressure drop. = 0.5 in. WG

Maximum coil face velocity = 500 FPM

Filter arrangement = flat type

Considering the required air flow rate in cfm and the unit available nominal air flow rate, air handling model SRAH - 1000 is chosen.

-From table 3 @ the given cooling capacity and the evap. temp. a 6-rows coils chosen (cooling capacity of units is 471 MBH)

-From table 6 @ the given heating capacity and the steam pressure of 5 psig , a 2-rows heating coil is chosen (Heating capacity of the unit is 980 MBH)

Determine the actual coil face velocity.

$$\text{Actual F.V.} = \frac{\text{CFM}}{\text{F.A.}} = \frac{9500}{20} = 475 \text{ FPM}$$

Referring to the correction factors in table 12, the cooling and the heating capacity correction factors given as 0.97 And 0.98 Respectively.

-Corrected cooling capacity =  $471 \times 0.97 = 456.8 \text{ MBH}$

-Corrected heating capacity =  $980 \times 0.98 = 960.4 \text{ MBH}$

Therefore, the chosen cooling and heating coils satisfy the requirements.

-Knowing the actual coil face velocity and the coils chosen, determine the total internal air side pressure drop for the unit.

- P.D. DX coil = P.D. (Table 10) x C.F. (Table 10A) =  $0.79 \times 1.45 = 1.15 \text{ in W.G}$

- P.D. Heating coil = P.D. (Table 10) x C.F. (Table 10A) = 0.21 x 1 = 0.21 in W.G

- P.D. Filter = 0.09 in W.G (table 9)

- P.D. Accessories = 0.05 in W.G (table 11) Total internal pressure drop (T.I.P.D)

Total external pressure drop (T.E.P.D)

$$\begin{aligned} T.I.P.D &= P.D. DX Coil + P.D. \text{ Heating coil} + P.D. \text{ Filter accessories} \\ &= 1.15 + 0.2 + 0.09 + 0.05 = 1.5 \text{ in W.G} \end{aligned}$$

Total static pressure (T.S.P) = T.I.P.D + T.E.P.D = 1.5 + 0.5 = 2 in W.G

Therefore, by using table 1 and performing interpolation the required fan size is determined as 56 cm at the speed of 629 RPM and electric motor power requirement of 5.5 kW.

**Fan Performance (Forward Curved)**

Model	Fan Quantity and Size (mm)	Coil Face area sq.ft <sup>2</sup>	FPM	CFM	Total static pressure in inches of water column

AHU 4500	1900		600	600	600	200	1800	5000	2100	120	300

Note:

- All Dimensions are in mm

For Air Handling Units with **HEPA filter** add 700 mm and also for each extra **BAG filter** add 100 mm to mentioned dimensions

## Multi Zone Air Handling Unit

Notes :

- Values based on entering chilled water temperature of 45 °F
- EDB = Entering air dry bulb temperature      -EWB = Entering air wet bulb temperature
- LVG = Leaving air temperature      - MBH = 1000 BTU/hr

## Filters

### 1- Washable Aluminum

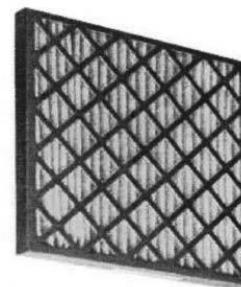

High capacity , low resistance , permanent metal filters , which can be Cleaned in hot water with detergent . They can be used for air cleanliness Required 65-70% arrestance or as an economical alternate to disposable Type pre – filter of high efficiency filter .

EU Class	2
Arrestance (%)	65 - 80

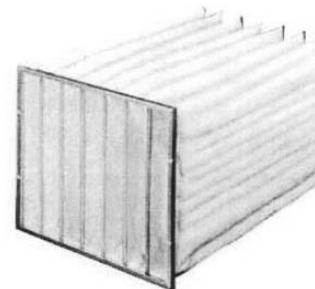

### 2- Panel Filter (Disposable)

Heavy duty disposable panel filters giving primary protection to the Conditioned space or protect more expensive secondary filters . They are available in synthetic fiber pleated media consist of continuous Filament glass fiber of progressive density .

EU Class	3	4	5
Arrestance (%)	80 - 90	90 – 95	-
Dust Spot Efficiency (%)	20 - 25	25 - 40	40 - 60

Panel Filter

Bag Filter

Hepa Filter

### 3- Bag Filter

When high performance air filtration long service life and high dust Holding capacity required in air handling unit , then extended surface Pock et filters are selected . filters are available in various efficiency depth , And number of pockets . Dust holding capacity is maximized because dirt is Evenly loaded through out the entire depth of the filter .

EU Class	6	7	8	9
Dust Spot Efficiency (%)	60 - 80	80 - 90	90 - 95	95 - 99

### 4- Hepa Filters

Hepa filter are used to remove airborne biological contaminants in hospital Critical area . pharmaceutical processing industries as well as to meet exact Requirements of the laboratories and precision manufacturing and micro Electronic industries . Filters are available in 99.97 or 99.99 % efficiency with plywood or galvanized steel casing . Hepa filters are installed on specially designed knife edge type seal framing system with pressure tight lock to prevent air by pass .

EU Class	11	12	13	14
Dust Spot Efficiency (%)	99.9 – 99.97	99.97 – 99.99	99.99 – 99.999	99.999 – 99.9995

## (Air Washer Features)

Azar Nasim air washers are designed & manufactured in three basic classes .

**Class 4 :**

A compact & economical single spray bank air washer specially designed for effective humidifying & air washing purposes .

**Class 6 :**

A single spray bank unit for medium capacity applications , an ideal air washer for most types evaporative cooling & air washing tasks .

**Class 8 :**

A highly efficient heavy duty unit with two spray banks used when ever . The utmost in heat transfer . Humidification or air cleaning is required .

Casings and water basins are made of galvanized steel sheets . Basins are 300 mm deep for classes 4 & 6 , 400 mm deep for class 8.

Moisture eliminators installed side by side in close proximity of each other preventing the water droplets from entering the fan section . They also present a large surface area against which water droplets & dust particles first impinge before ending up in the basin .

Centrifugal spray nozzles , contain no cores , vanes of obstructions of any kind and all inside surface are smooth . Nozzles have removable caps which can be taken off for cleaning purposes .

Brass flooding nozzles are installed on separate headers extending across the air washer . They deliver a solid flat stream of water on to the eliminator surface in order to wash off the dust particles & deposits . An access door with glass inspection window is available on all models .

Make – up water connection & an automatic float valve which controls the water level in the basin are provided .

Quick fill connection to which the fresh water supply may be connected is furnished for rapid filling of the basin .

## Evaporative Cooling Efficiency (E) / Class 4

## (Air Washer Selection Procedure)

Given Data:

- Entering air DB temperature = 95 °F
- Entering air WB temperature = 63 °F
- Sensible cooling load = 85 MBH
- Design air flow rate = 10000 CFM
- Room DB temperature = 77 °F

Determine the required air washer model , $Q = 1.085 \times \text{CFM} \times (\text{DB Room} - \text{DB Lvg.})$

$$\text{DB Lvg.} = \text{DB Room} - \frac{Q}{1.085 \times \text{CFM}} = 77 - \frac{85000}{1.085 \times 10000} = 69.16 \text{ }^{\circ}\text{F}$$

Considering the required air flow rate in CFM & the unit available nominal air flow rate , air handling unit model AHU – 1000 is chosen .

Evaporative cooling efficiency (E) is determined as ,

$$E = \frac{\text{DB Ent} - \text{DB Lvg.}}{\text{DB Ent} - \text{WB Ent}} = \frac{95 - 69.16}{95 - 63} = 0.8$$

The coil face area for model 1000 is 20ft<sup>2</sup> there fore .

$$F.V = \frac{10000}{20} = 500 \text{ FPM}$$

Considering the air velocity & the values in table (A) the (E) value for Class 4 air washer is equal to 0.555 which is less than the calculated value there fore Class 4 air washer dose not satisfy the requirement . In this case since the (E) value is known , the (P.F) value from table (B) is determined as being equal to 0.75

Now , considering the unit model AHU – 1000 , the (P.F) value & table (C) the (P.F) value for Class 6 air washer is less than the value calculated there fore , Class 8 washer satisfies the requirement . We also notice that the (P.F) value given is 0.821 there fore , the actual (E) value is 0.856 (Table B) the Lvg. Air DB temperature is given as .

$$DB_{Lvg} = DB_{Ent} - E \times (DB_{Ent} - WB_{Ent}) = 95 - 0.821 \times (95 - 63) = 68.7 \text{ }^{\circ}\text{F}$$

There fore , the actual air washer cooling capacity is given as.

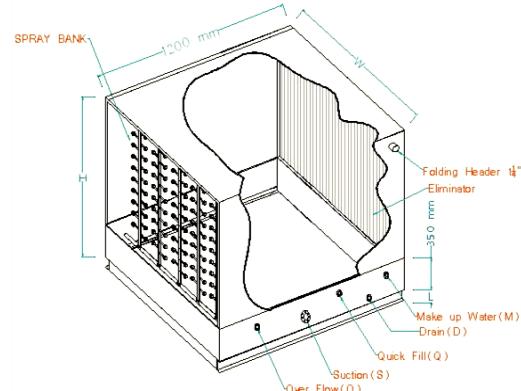

$$Q = 1.085 \times CFM \times (DB_{Room} - DB_{Lvg}) = 1.085 \times 10000 \times (77 - 68.7) = 90055 \text{ BTU/hr} \sim 90 \text{ MBH}$$

Entering the psycho metric chart with the leaving air DB & WB temperatures of 68.7 °F & 63 °F respectively , the relative humidity of the air is determined to be 73% .

Note :

Abbreviations Ent & Lvg are air Entering & Leaving air washer .
